

**International Accreditation Forum, Inc.**

**IAF Mandatory Document**

**IAF Mandatory Document  
for the  
Application of ISO 14065:2007**

**Issue 1  
(IAF MD 6:2009)**

The International Accreditation Forum, Inc. (IAF) operates programs for the accreditation of bodies that provide conformity assessment services, and such accreditation facilitates trade and reduces demands for multiple certifications.

Accreditation reduces risk for business and its customers by assuring them that accredited Conformity Assessment Bodies (CABs) are competent to carry out the work they undertake within their scope of accreditation. Accreditation Bodies (ABs) which are members of IAF and their accredited CABs are required to comply with appropriate international standards and IAF mandatory documents for the consistent application of those standards.

AB members of the IAF Multilateral Recognition Arrangement (MLA) conduct regular evaluations of each other to assure the equivalence of their accreditation programs. The IAF MLAs operate at two levels:

- A MLA for the accreditation of CABs to standards including ISO/IEC 17020 for inspection bodies, ISO/IEC 17021 for management systems CABs, ISO/IEC 17024 for personnel CABs and ISO/IEC Guide 65 for product CABs, is considered a framework MLA. A framework MLA provides confidence that accredited CABs are equally reliable in the performance of conformity assessment activities.
- A MLA for the accreditation of CABs that also includes the specific conformity assessment standard or scheme as a scope of accreditation provides confidence in the equivalence of certification.

An IAF MLA delivers the confidence needed for market acceptance of certification. An organization or person with certification to a specific standard or scheme that is accredited by an IAF MLA signatory AB can be recognized worldwide thereby facilitating international trade.

Issue No 1

Prepared by: IAF Technical Committee

Approved by: IAF Members

Date: 8 January 2009

Issue Date: 15 February 2009

Application Date: 15 February 2010

Name for Enquiries: John Owen, IAF Corporate Secretary

**Introduction to IAF Mandatory Documents**

The term “shall” is used in this document to indicate those provisions which, reflecting the requirements of the relevant standard, are mandatory. The term “should” is used in this document to indicate recognised means of meeting the requirements of the standard. A validation or verification body can meet these in an equivalent way provided this can be demonstrated to an Accreditation Body (AB).

**IAF Mandatory Document for the Application of ISO 14065:2007****0 INTRODUCTION**

0.1. ISO 14065:2007 is an International Standard which sets out requirements for bodies that undertake Greenhouse Gas (GHG) validation or verification using ISO 14064-3 or other relevant standards or specifications. ISO 14065 provides to GHG programme administrators, regulators and accreditors, a basis for assessing and recognising the competence of validation or verification bodies (V/VB).

Statements issued by accredited V/VBs are relied upon in a number of areas, critically in “emission trading schemes”, both in regulated and voluntary markets. The value attributed to a tonne of CO<sub>2</sub> for the purpose of commodity trading, or other future actions by interested parties, is reliant upon the confidence in the verified emissions data and consequently upon the V/VB that undertakes the work and issues the statement.

ISO 14065 is not, as yet, included within the IAF MLA Framework documents, however if V/VBs are to be accredited worldwide in a harmonized manner as complying with ISO 14065, additional application guidance is necessary to limit variations in interpreting the Standard. This Mandatory Document provides additional application guidance to enable harmonization by IAF members for the assessment of V/VB against ISO 14065 and related standards. This is an important step towards multilateral recognition of accreditation.

This document will therefore be referenced in future IAF MLA and will be considered mandatory for the consistent application of ISO 14065. Members of the IAF MLA, and applicants for membership in that Arrangement, will assess each others’ implementation of ISO 14065. This Mandatory Document is expected to be adopted by accreditation bodies as part of their general rules for accreditation.

It is intended that this document should also be useful to V/VB themselves and to those whose decisions are guided by V/VB validation or verification statements. Validation is the process by which a validation body assesses a project’s GHG project plan against defined validation criteria (this process therefore deals with the assessment of potential future outcomes). Verification is a process where a verification body assesses an organisation’s or project’s GHG assertion against defined verification criteria (this process therefore deals with historical outcomes). In fact for ISO 14064-1 and ISO 14064-2 the assessment will cover both conformance with the standard and that the GHG assertion is reliable and correct based on the agreed level of assurance, materiality, criteria, objectives and scope. In the emission trading area it is imperative that the V/VB should be aware of the consequences of double counting and double registry issues when issuing a validation or verification statement.

A validation or verification assessment process is unique to each client's assessment and varies year to year. ISO 14064-3 Annex A provides explanation of the requirements for the validation and verification processes.

0.2. This document does not include the text of ISO 14065 or where referenced ISO 14064-3. It does follow the clause headings from ISO 14065; hence there are clauses with no applicable application guidance based on the IAF TC decision 6 November 2002 in [Cancun](#) .not to provide any application guidance for ISO/IEC 17021.

The normative reference in ISO 14065 is ISO 14064-3. The terminology used in the two standards is somewhat different from that currently in use in management systems. To help understanding and facilitate reading across from the two normative standards, Clause 8 as well as Annex C of this Mandatory Document links the relevant clause titles from ISO 14065 with relevant clause titles from ISO 14064-3. The clause titles from ISO 14064-3 are in blue text and preceded by the reference ISO 14064-3. The process for validation and verification is different from management systems auditing as well as there being a different focus between validation and verification. Annex C has therefore been developed to provide informative guidance related to this process. In Annex C clause headings from ISO 14064-3 have been used to allow understanding of how the application guidance interacts with the normative references. Again the title headings are included but with no application guidance where none was deemed necessary.

*Note - Text in this document should not be taken as an interpretation of either ISO 14065 or ISO 14064-3.*

0.3. Users of this Mandatory Document need to purchase the Normative References listed in Clause 2 from the appropriate Standards organization.

0.4. Application Guidance where it is offered is identified with the letter "A".

## 1. SCOPE

A.1.1. This Mandatory Document is applicable to validation or verification bodies (V/VB) for the following validation or verification criteria:

- ISO 14064-1 or ISO 14064-2; or
- Regulated GHG programmes which are publicly available and have been developed using a formal stakeholder engagement process; or
- Publicly available GHG programmes (e.g. World Resources Institute and World Business Council for Sustainable Development [WRI/WBCSD] GHG protocol) that are international or regional and have been developed using a formal stakeholder engagement process; or
- Non public industry or sector protocols; in this case the validation or verification criteria shall additionally include either ISO 14064-1 or ISO 14064-2 dependent on whether the protocol relate to organisation or project GHG assertions. The resulting validation or verification statement shall clearly state whether the non public industry or sector protocol conforms to ISO 14064-1 or ISO 14064-2 and if the protocol does not conform it shall state where the discrepancies are.

A.1.2. The validated or verified GHG assertion may include a statement of emission per unit of product manufactured (generated or reduced) or similar. If the client wish to use statements taken from the GHG assertion for communication purposes these statement shall either:

1. Clearly state where the statement came from including the date of the GHG assertion, whether the statement is based on historical data and any limitation associated with the statement based on the data and information presented in the GHG assertion. Any statement shall meet ISO 14021:2001 Clause 5.7;

OR if 1 above does not apply;

2. The statement shall additionally meet all requirements in ISO 14021:2001 Clause 5.1 to 5.9;

*Note - The V/VB should evaluate whether the client wishes to extract statements from the GHG assertion and ensure that any extracts are not associated with any mark or logo. Unless the arrangements in A.1.2. (point 3 below is followed).*

AND in either case 1 or 2 of A.1.2 above the following shall apply;

3. If the client wishes to apply a mark or make reference to the V/VB on the product or product packaging, including using the V/VB mark or a GHG programme mark, the V/VB's validation or verification process shall

additionally address requirements of ISO/IEC Guide 65:1996 and IAF GD 5:2006.

*Note - ISO 14021:2001, Clause 5.7, provides guidance for organisations seeking to make self-declared environmental claims.*

## 2. NORMATIVE REFERENCES

ISO 14065:2007 - Greenhouse gases: Requirements for greenhouse gas validation and verification bodies for use in accreditation or other forms of recognition

ISO 14064-3:2006 Greenhouse gases: Specification with guidance for the validation or verification of greenhouse gas assertions

*Note- The Bibliography sets out the references to the documents mentioned in this Mandatory Document which are not normative references.*

## 3. TERMS AND DEFINITIONS

### 3.1. Definitions

A.3.1.1. Definitions in ISO 14065 apply to this document. The following additional definitions shall apply in this document:

#### A.3.1.2. Competence

demonstrated ability to apply knowledge and/or skills and, where relevant, demonstrated personal attributes.

*(Adapted from ISO/IEC 17024:2003)*

#### A.3.1.3. Greenhouse gas assertion (GHG assertion)

factual and objective declaration made by the responsible party

*Note 1 The GHG assertion could be presented at a point in time or could cover a period of time.*

*Note 2 The GHG assertion provided by the responsible party should be clearly identifiable, capable of consistent evaluation or measurement against suitable criteria by a validator or verifier.*

*Note 3 The GHG assertion could be provided in the form of a greenhouse gas report or GHG project plan.*

*(ISO 14065:2007)*

**A3.1.4. Greenhouse gas programme (GHG programme)**

voluntary or mandatory international, national or sub-national system or scheme that registers, accounts or manages GHG emissions, removals, greenhouse gas emission reductions or greenhouse gas removal enhancements outside the organization or GHG project

*(ISO 14065:2007)*

**A.3.1.5. Grouped project**

A number of projects included in a single GHG project plan and a single GHG assertion at the time of the validation and verification.

*(Adapted from Voluntary Carbon Standard [VCS] 2007)*

**A.3.1.6. Impartiality**

actual and perceived presence of objectivity.

*Note 1 - Objectivity means that conflicts of interest do not exist or are resolved so as not to adversely influence subsequent activities of the V/VB.*

*Note 2 - Other terms that are useful in conveying the element of impartiality are: objectivity, independence, freedom from conflict of interests, freedom from bias, lack of prejudice, neutrality, fairness, open-mindedness, even-handedness, detachment, balance.*

*(ISO/IEC 17021:2006)*

**A.3.17. Material discrepancy**

individual or the aggregate of actual errors, omissions and misrepresentations in the greenhouse gas assertion that could affect the decisions of the intended users

*(ISO 14064-3:2006)*

*Note – material discrepancies that remain after the conclusion of the validation or verification shall be reflected in the validation or verification opinion and conclusion.*

**3.2. Terms used in this document**

The terms used in this document are taken from the ISO 14064 series. Where a GHG programme acceptable under A.1.1 uses different terms and definitions these shall be used and their link with definitions and terms in this document shall be evaluated and the consequence of any variation understood by the V/VB.

**Note** - For the purpose of this document, validation of a project GHG assertion is related to the future GHG emission reductions or enhancements associated with the project. Verification of a project GHG assertion is related to actual historical GHG emission reductions or enhancements associated with the project. Organisational GHG assertions relate to actual historical data and are verified.

Terms used in this document to simplify text include:

A.3.2.1. **Strategic analysis** –based on requirements in Clause 4.4.1 of ISO 14064-3 this means:

“A review of the organization's or project's GHG information to assess;

- the nature, scale and complexity of the validation or verification activity to be undertaken on the client's behalf;
- confidence in the responsible party's GHG information and assertion;
- completeness of the responsible party's GHG information and assertion; and
- the eligibility of the responsible party to participate in the GHG programme, if applicable.”

A.3.2.2. **Assessment of risks** - based on requirements in Clause 4.4.1 of ISO 14064-3 this means:

“The assessment of sources and the magnitude of potential errors, omissions and misrepresentations related to the validation or verification activities. The categories of potential errors, omissions and misrepresentations assessed shall be the following:

- a. the inherent risk of a material discrepancy occurring;
- b. the risk that the controls of the organization or GHG project will not prevent or detect a material discrepancy;
- c. the risk that the validator or verifier will not detect any material discrepancy that has not been corrected by the controls of the organization or GHG project.”

**Note 1** - The assessment of risk is related to the risk that the V/VB expresses an inappropriate conclusion and opinion. The V/VB reduces risk through the design and implementation of a validation and/or verification process, which will lead to the reasonable expectation of identification of material discrepancy. Validation and verification risk should be reduced to an acceptably low level to obtain the appropriate level of assurance as agreed in the contract.

**Note 2** -Strategic analysis identifies **what** the validation and verification team needs to look at and the assessment of risk identifies **how** to look at the issues identified.

A.3.2.3. **Professional judgement** – is the ability to draw meaningful and accurate conclusions, give opinions and make interpretations based on observations, knowledge,

experience, literature and other sources of information. Professional judgement is based on facts and objective evidence, as well as experience, which includes some subjectivity.

#### **4. PRINCIPLES**

##### **4.1. General**

##### **4.2. Impartiality**

##### **4.3. Competence**

##### **4.4. Factual approach to decision making**

##### **4.5. Openness**

##### **4.6. Confidentiality**

#### **5. GENERAL REQUIREMENTS**

##### **5.1. Legal status**

A.5.1.1. A governmental V/VB is deemed to be a legal entity on the basis of its governmental status.

##### **5.2. Legal and contractual matters**

A.5.2.1. The legally enforceable agreement shall include a policy governing marketing and other references to the V/VB that the V/VB authorizes its clients to use with respect to any GHG assertion. Where there is a licence to use a validation or verification mark, or specific text, there shall be no ambiguity in the proposed use of the GHG assertion that has been validated or verified. The policy shall ensure, among other things, that no mark (as related to either the V/VB mark licensed to the client or a GHG programme mark where the V/VB is responsible for monitoring the use of rules related to the application of the mark) or reference to the V/VB is placed on products or product packaging in a way that may be interpreted as denoting product certification, unless the validation or verification activity is performed in accordance with ISO/IEC Guide 65 and associated IAF mandatory documents as referred to in A.1.2. of this document.

A.5.2.2. The legally enforceable agreement shall include a policy governing statement(s) taken from the validated or verified GHG assertion that the V/VB allows a client to use, including time limits and language, refer to A.1.2. The legally enforceable agreements shall also include requirements related to the use of the V/VB mark that may “endorse” the statement(s) made by the client.

*Note - requirements applicable above in A.5.2.1. relate to the use of the V/VB mark on products applies to A.5.2.2.*

### **5.3. Governance and management commitment**

A.5.3.1. In addition to documenting the responsibilities of top management, the V/VB shall document the responsibilities of other personnel involved in the validation or verification process.

A.5.3.2. The V/VB shall ensure it carries out validation or verification processes consistent with the requirements of ISO 14065. In addition, the V/VB shall ensure that their systems are sufficiently documented to ensure the consistent application of any specific validation or verification criteria, reference A.1.1, which they choose to offer.

A.5.3.3. The V/VB shall establish a development process for each new validation or verification criteria (refer to A.1.1.) in which it wishes to operate. This development process shall provide outputs related to the following:

- Identification of key stakeholders, and their expectations and requirements as applicable to the outcome of validation or verification activities;
- Review and understanding of the applicable validation or verification criteria requirements, involving the criteria owner where necessary;
- Consideration of V/VB strategic and business risks;
- Identification of the competence requirements for validators or verifiers, independent reviewers and support personnel, as relevant to each validation or verification criteria (refer A.1.1.);
- Validation or verification criteria (refer A.1.1.) specific validation or verification requirements;
- Confirmation that the proposed validation or verification arrangements will meet the validation or verification criteria (refer A.1.1.) requirements; and
- Confirmation that the validation or verification criteria satisfy A.1.1.

### **5.4. Impartiality**

### **5.5. Liability and financing**

## **6. COMPETENCIES**

### **6.1. Management and personnel**

A.6.1.1. In determining a “sector”, a V/VB shall consider that the term “sector” has different meanings for different types of validations and verifications. For any validation or verification, the term is related to the GHG assertion (whether associated with a GHG project or GHG inventory) and the expectations of interested parties. This enables a validator or verifier to comprehend the context (e.g. sources, sinks and reservoirs, industrial plant and processes, product supply chain process, boundaries, additionality, leakage etc. as appropriate) in which a validation and verification is being conducted.

## 6.2 Competencies of personnel

A.6.2.1. The V/VB shall have personnel evaluated by a competent evaluator.

A.6.2.2. The V/VB shall demonstrate how personnel have been evaluated and found to satisfy the following competence requirements as applicable:

- Competence related to management of an engagement;
- Generic validation competencies as per ISO 14065 Clause 6 and Annex A of this document, plus any validation or verification criteria (refer A.1.1) specific and/or sector specific validation competencies;
- Generic verification competencies as per ISO 14065 Clause 6 and Annex A of this document, plus any validation or verification criteria (refer A.1.1) specific and/or sector specific verification competencies.

*Note 1 - In case where organisation verification includes project verification the V/VB competence criteria needs to take account of all relevant competence criteria as per above including those associated with project validation or project verification.*

*Note 2 - There are a number of tools used to evaluate personnel; these can be combined in any suitable manner. Typical tools include;*

- *Witnessing of a verification and/or validation activity as applicable;*
- *Internal peer review of validation or verification documentation;*
- *Structured interview to test knowledge and technical competence;*
- *Examination;*
- *Performance review – by management and/or other team member;*
- *Certification by an accredited personnel certification body to the extent that the certification provides a demonstration of the competencies specified in this V/VB system;*
- *Recognised technical standing in terms of being asked to speak at conferences, or publish papers if peer reviewed;*
- *Adequate evidence of relevant previous experience;*

**6.3. Deployment of personnel****6.4. Use of contracted validators or verifiers****6.5. Personnel records****6.6. Outsourcing****7. COMMUNICATIONS AND RECORDS****7.1. Information provided to a client or responsible party****7.2. Communication of responsibilities to a client or responsible party****7.3. Confidentiality****7.4. Public associable information****7.5. Records****8. VALIDATION OR VERIFICATION PROCESS**

*Note 1 - Taken from Introduction 0.2 To help understanding and facilitate reading across from the two normative standards, Clause 8 as well as Annex C of this Mandatory Document link the relevant clause titles from ISO 14065 with relevant clause titles from ISO 14064-3. The clause titles from ISO 14064-3 are in blue text and preceded by the reference ISO 14064-3. The process for validation and verification is different from management systems auditing as well as there being a different focus between validation and verification. Annex C has therefore been developed to provide informative guidance related to this process. In Annex C clause headings from ISO 14064-3 have been used to allow understanding of how the application guidance interacts with the normative references. Again the title headings are included but with no application guidance where none was deemed necessary.*

*Note 2 - Text in this document should not be taken as an interpretation of either ISO 14065 or ISO 14064-3.*

**8.1. General****8.2. Pre-engagement****8.2.1. Impartiality****8.2.2. Competence****8.2.3. Agreement****ISO 14064-3 Clause 4.3. Level of assurance, materiality, objectives, criteria and scope of the validation or verification****4.3.1. Level of assurance**

[4.3.2. Objectives](#)[4.3.3. Criteria](#)[4.3.4. Scope](#)[4.3.5. Materiality](#)

A.8.2.3.1. The V/VB shall have a documented management system (as per Clause 12) for responding to requests for validation and/or verification. The V/VB procedures shall ensure that prior to any quotation or agreement, sufficient information is obtained regarding the scope, objective, criteria, level of assurance and materiality of the validation or verification. The quotation shall be developed based on the information obtained taking into account the key issues applicable to the GHG assertion and the objectives of the validation or verification consistent with the validation or verification criteria, (refer A.1.1.) and the intended user as applicable to the GHG assertion.

A.8.2.3.2. When considering quoting for validation or verification of a GHG assertion, the V/VB shall consider the key issues related to developing a quote, as applicable, including the:

- Proposed level of assurance, materiality, criteria, objectives and scope;
- Complexity of the GHG assertion;
- Complexity of the project or organisation and its measurement/monitoring processes;
- Organisational environment including the structure of the organisation that develops and manages the GHG assertion;
- Baseline scenario for project validation and verification, including selection and quantification of GHG sources, sinks and reservoirs applicable to the baseline scenario;
- Identified GHG sources, sinks and reservoirs, and their monitoring for organisation verification;
- Processes that deliver the information and data in the GHG assertion;
- Organisational links and interactions between stakeholders, responsible parties, client, and intended users; (for definition refer to ISO 14064-3); and
- Validation or verification criteria (refer A.1.1) requirements.

A.8.2.3.3. The time needed to carry out the validation or verification shall be determined by the V/VB. The time allocation shall be justified based on the review of the above information and recorded by the V/VB. Each engagement has unique aspects and the validation or verification process shall be customized accordingly.

A.8.2.3.4. In cases where the V/VB quotation/agreement relates to a grouped project, the V/VB shall additionally consider logistics and planning related to validation or verification of the individual project(s) input to the grouped project single GHG assertion, and its impact on the duration of the validation or verification.

A.8.2.3.5. The V/VB should take into account the information in Annex B when determining the time requirements for validation or verification of a GHG assertion related to a grouped project.

A.8.2.3.6. In cases where the verification body quotation relates to a GHG assertion, which is based on a GHG inventory that includes a number of separate facilities level data and information inputs, the verification body shall additionally consider logistics and planning related to verification of the input from individual and combined facility(ies) data and related information to the GHG assertion, and its impact on the verification duration.

A.8.2.3.7. The V/VB should take into account the information in Annex B when determining the time requirements for verification of a single GHG assertion, which includes a number of separate facilities level data and information inputs.

A.8.2.3.8. The V/VB agreement (including any schedules or attachments) shall identify the proposed level of assurance, materiality, criteria, objectives and scope, including the agreed validation or verification criteria (refer A.1.1.) as applicable, as well as the proposed validation or verification duration, and time frame for the proposed validation or verification.

*Note - The term “agreement” and “contract” in ISO 14065 Clause 8.2.3 has the same meaning.*

#### **8.2.4. Appointing the team leader**

### **8.3. Approach**

#### **8.3.1. Selecting the validation or verification team**

A.8.3.1.1. The V/VB shall have a process for selecting and appointing the validation and verification team, including the team leader, taking into account the competencies needed to achieve the level of assurance, materiality, scope, criteria and objectives of the validation or verification and, in addition, the effective management of the work including interfacing with the client organisation. (Refer Clause 6).

#### **8.3.2. Communicating with the client and responsible party**

#### **8.3.3. Planning**

#### **ISO 14064-3 Clause 4.4. Validation or verification approach**

##### **4.4.1. General**

##### **4.4.2. Validation or verification plan**

##### **4.4.3. Sampling plan**

A.8.3.3.1. The agreed validation or verification criteria shall include one of the options from A.1.1.

A.8.3.3.2. The principles of the agreed criteria for validation or verification shall be used during the validation or verification process. The validation and verification criteria shall meet requirements as set down in A.1.1.

A.8.3.3.3. The principles as applicable to the agreed validation or verification criteria, (refer A.1.1.), shall be used by the V/VB and the validation or verification team to guide the validation or verification process, including evaluation of findings, conclusions, opinions and decisions reached regarding the GHG assertion.

A.8.3.3.4. For project validation, the validation objectives shall include whether the planned project could reasonably be expected to achieve the claimed reduction and /or removal enhancements.

A.8.3.3.5. When verification criteria include ISO 14064-1, where a GHG report is optional, and if the client chooses to issue a public GHG report which is verified, the V/VB shall confirm that the GHG report conforms to the applicable requirements for a GHG report reference Clause 7.2 and 7.3 of ISO 14064-1.

A.8.3.3.6. When the verification criteria include ISO 14064-1 the verification body shall ensure that if the organisation makes public a GHG assertion claiming conformance to ISO 14064-1, the organisation shall make available to the public a GHG report prepared in accordance with ISO 14064-1 or an independent third-party verification statement related to the GHG assertion. If the organization's GHG assertion has been independently verified, the verification statement shall be made available to intended users.

A.8.3.3.7. When the validation criteria include ISO 14064-2, the review of a GHG assertion and its associated GHG project information shall include the validation of the client's justification for "selection or establishment of the criteria and procedures" relating to Clauses 5.3, 5.4, 5.5, 5.6, 5.7, 5.8 and 5.10 of ISO 14064-2.

A.8.3.3.8. When the validation criteria, (refer A.1.1.), allows the project proponent or client to select or establish criteria or procedures that relate to the determination of the baseline scenarios, GHG sources, sinks or reservoirs, monitoring processes etc. (refer ISO 14064-2 for an indication of areas) the validation shall include an assessment of the project participant's or client's justification for the selection of criteria or procedures.

A.8.3.3.9. The development of the validation and verification approach shall be based

on the agreed criteria, scope, objectives, level of assurance and materiality; not just the quoted validation or verification duration. The validation or verification duration shall be increased or decreased as necessary throughout the planning process. The team competencies shall be reviewed as a result of the outcome of the planning process.

A.8.3.3.10. The V/VB shall obtain sufficient information using a systematic, interactive, and where necessary, iterative process to input to the planning process.

A.8.3.3.11. The V/VB shall review the outcome of the planning process in light of evidence and information gathered during the validation or verification process and amends the plans accordingly.

A.8.3.3.12. The output from the strategic analysis shall be used as an input to the assessment of risks, sampling plan and validation or verification plan.

*Note 1 - Assessment of risks takes into account the level of assurance, materiality, criteria, scope and objective of the validation or verification, changes in these will affect the depth and detail of the assessment of risks.*

*Note 2 – Refer to Annex B for issues to be considered in developing the validation or verification plan for a GHG assertion covering either a grouped project or that includes more than one facility in the GHG inventory.*

A.8.3.3.13. The V/VB shall ensure that the planned mandays are appropriate to meet the sampling plan and validation or verification plan developed as the outcome of the strategic analysis and assessment of risks.

A.8.3.3.14. The V/VB shall ensure that any conflict between the mandays quoted and the mandays needed to deliver the engagement based on the outcome of the strategic analysis and assessment of risks is resolved.

A.8.3.3.15. The V/VB shall revise the validation or verification plan and sampling plan where the V/VB have identified or agreed to changes with the client related to validation or verification criteria, scope, materiality, level of assurance or objectives, or findings emerge that affect the conclusion of the strategic analysis and/or the assessment of risks.

A.8.3.3.16. The specific data and information to be sampled shall be determined as part of the validation or verification planning and not on a spur of the moment during the data and information validation or verification. The sampling plan shall be detailed and documented before the commencement of the data and information validation or verification and shall be revised as necessary during the validation or verification. The development of the sampling plan shall determine the amount of information, evidence

and data necessary to achieve the agreed scope, criteria, objectives, level of assurance and materiality.

A.8.3.3.17. In approving the validation or verification plan the validation or verification team leader shall ensure that it is complete and that all sub elements of the plan provide for a complete integrated validation or verification process consistent with the agreed criteria, scope, objectives, level of assurance and materiality of the engagement.

A.8.3.3.18. In approving the validation or verification plan the validation or verification team leader shall confirm that the validation or verification duration, team competencies and team member assignments are adequate and fit the needs of the validation or verification.

A.8.3.3.19. The validation and verification team shall ensure that there is consistency between the validation or verification plan and the contractually agreed objectives, scope, criteria, level of assurance and materiality. The validation or verification documentation shall clearly identify any approved variations to the agreement.

A.8.3.3.20. Annex C may be used to explain and support validation or verification processes and systems.

#### **8.4. Validation or verification**

##### **ISO 14064-3 Clauses:**

##### **4.5. Assessment of GHG information system and its controls**

##### **4.6. Assessment of GHG data and information**

##### **4.7. Assessment against validation or verification criteria**

##### **4.8. Evaluation of the GHG assertion**

A.8.4.1. The validation or verification shall be conducted with an attitude of professional scepticism, which assumes that the presented information and data may be wrong until proven differently, and take account of relevant stakeholder or market concerns and the applicable validation or verification criteria, associated principles.

A.8.4.2. The verification body shall review any changes to GHG project or organization structure, GHG project plan or GHG inventory since the last verification. For GHG project verification the verification body shall additionally consider:

- Outstanding issues from the validation report;
- The status of the implementation of the project; and
- Reliability of the external information and data used to justify the GHG emission determination.

A.8.4.3. Verification of a project GHG assertion includes, in addition to verification of an organisation GHG assertion:

- Review of the validation report for the project;
- Verification of any changes to the GHG project plan including:
  - the identified GHG sources, sinks and reservoirs;
  - baseline scenario;
  - selection and quantification of GHG sources, sinks and reservoirs applicable to baseline scenario; and
  - monitoring of the GHG project.
- Verification of any changes to the justification for “selection or establishment of the criteria and procedures” referred to in A.8.3.3.7 and A.8.3.3.8 and its implementation;
- Verification of any changes to the organisational links and interactions between stakeholders, responsible party (project proponent in some GHG programmes), client, and intended users; (for definitions refer ISO 14064-3).

A.8.4.4. The level of risk mitigation provided by the GHG information systems and controls shall impact the detail and level of validation or verification sampling.

*Note* – ISO 14064-3 does not impose a formal requirement on an organisation or project to have GHG information systems or controls or for such GHG information system or controls to meet ISO 14064-3 Clause 4.5.

A.8.4.5. Where the validation or verification criteria (refer A.1.1.), impose requirements related to the GHG information systems or controls, conformance with these requirements shall be validated or verified

A.8.4.6. In cases where errors, omissions or misstatements are identified in the GHG data and information, the validation and verification team shall require that these are corrected by the client, and, increase the sampling. Where errors, omissions or misstatements can not be corrected the V/VB shall qualify the validation or verification statement.

*Note* – For an understanding of what qualification of a validation and verification statement means see ISO 14064-3 A.2.9.2

A.8.4.7. The assessment of GHG data and information includes confirmation of the operability of the software and hardware used to process or generate the GHG data and information.

*Note* - Consideration should be given to controls of such hardware and software including issues such as validation of software, where relevant, back up of data, calibration of monitoring equipment, reliability of external data, etc.

A.8.4.8. The V/VB shall consider the applicable definitions in the agreed validation or verification criteria (refer A.1.1) when determining whether a GHG assertion conforms to the validation or verification criteria.

A.8.4.9. Input in to the assessment of the GHG assertion shall include:

- Contract requirements related to scope, criteria, objectives, level of assurance and materiality as well as any validation or verification criteria (refer A.1.1) specific requirements;
- GHG assertion;
- Output from the strategic analysis and assessment of risks;
- Output from the assessment of GHG information system and controls;
- Output from the assessment of GHG data and information; and
- Output from the assessment against validation or verification criteria.

A.8.4.10. In evaluating the risk of material discrepancies related to the GHG assertion, the V/VB shall consider:

- Views of the intended user;
- Relevance and relative contribution of the various GHG emissions from all GHG sources, sinks and reservoirs;
- Adequacy of the GHG information system and controls;
- Complexity of organisation or GHG project operations;
- Monitoring process applicable to the GHG project or organisation; and
- Relevant evidence from previous validations or verifications, as applicable.

A.8.4.11. The output from the assessment of the GHG assertion shall confirm that:

- Evidence gathered is sufficient to validate or verify the GHG assertion in line with the scope, criteria, objectives, materiality and level of assurance as agreed in the contract;
  - Validation and verification process, as carried out, has delivered the level of assurance as agreed;
  - Sampling and its results support or not a conclusion that there are no material discrepancies in the GHG assertion;
  - GHG assertion is free from material discrepancy based on the evidence and findings from the validation or verification process and the agreed scope, objective, criteria, materiality and level of assurance. If the evidence and findings are not sufficient to reach this conclusion then; either:
    - the level of assurance and / or materiality of the engagement shall be amended;
- OR
- the one of the following types of opinion may be formed:
    - “adverse”;

- “qualified”;
- a disclaimer of opinion.

*Note 1 – For support in developing a “qualified” and “adverse” validation or verification statements, refer to ISO 14064-3, A.2.9.2 and A.2.9.3.*

*Note 2 – “qualified” or “adverse” validation or verification statements should not be confused with the terminology associated with limited level of assurance or reasonable level of assurance; refer to ISO 14064-3 A.2.3.2.*

A.8.4.12. The validation or verification team shall submit to the V/VB, evidence and findings to substantiate and supports its recommendations. The evidence and findings shall link to the agreed validation or verification plan and sampling plan and be sufficient for the V/VB to carry out an effective independent review (refer to ISO 14065 Clause 4.9).

A.8.4.13. The validation or verification team should submit to the V/VB for their review and approval a draft validation or verification statement.

*Note - The draft validation or verification statement may be shared with the client.*

A.8.4.14. The validation or verification team shall ensure that all material discrepancies are reported to the client including explaining their potential impact on the validation or verification statement.

## **8.5. Review and issuance of validation or verification statement**

### **ISO 14064-3 Clause 4.9 Validation and verification statement**

A.8.5.1. In concluding (refer ISO 14065 Clause 8.5) the independent reviewer shall take into account the evidence resulting from the following:

- Validation or verification plan, sampling plan and validation or verification process and its stated conclusions and opinions are consistent with the agreement related to level of assurance, materiality, criteria, objectives and scope;
- Findings from the strategic analysis and the assessment of risks;
- Design of the validation and verification process and its stated conclusions and opinions are consistent with the requirements in the contract;
- Changes to the validation or verification plan or the sampling plan ;
- Conclusion reached on GHG data and information;
- Recommendation related to GHG assertion;

A.8.5.2. The independent reviewer shall determine whether the validation or verification statement is consistent with findings from the validation or verification activities and that its stated conclusions and opinions are consistent with finding from the validation or verification and that nothing material has been omitted.

A.8.5.3. The independent reviewer shall determine whether the validation or verification statement meets the requirements in validation or verification statements set out in the validation or verification criteria (refer A.1.1.). Where there is no validation or verification statement requirement(s) set out in the validation or verification criteria the validation or verification statement shall meet ISO 14064-3 Clause 4.9.

A.8.5.4. An accredited validation and/or verification statement related to a GHG assertion that does not include quantified GHG emissions data related to an organisation or GHG project shall only be issued if:

- There is a legal agreement between the V/VB and the client that any new GHG report, GHG project plan or GHG assertion released by the client subsequent to the initial validation or verification statement is validated or verified;
- For an organisation, a (internal) GHG verification report conforming to ISO 14064-1, Clause 7.3, is part of the scope of the verification;
- ISO 14064-1 or ISO 14064-2 is part of the validation or verification criteria and the requirements are not reduced; and
- The validation or verification statement is clear about what has been validated / verified and does not use language associated with management system certificates or conformity statements.

A.8.5.5. The validation and verification statement shall:

- Conform with ISO 14064-3, Clause 4.9, except in cases where regulated requirements overrule this;
- Be consistent with the outcome of the V/VB review; and
- Be issued to the responsible party.

A.8.5.6. The level of assurance for non regulated markets can vary across a validation or verification so some data or information is assured to reasonable level of assurance and some data or information is assured to limited level of assurance. In this case the validation or verification statement shall identify the applicable level of assurance related to each conclusion and how each conclusion influences the final opinion.

## **8.6. Records**

## **8.7. Facts discovered after the validation or verification**

**9. APPEALS**

**10. COMPLAINTS**

**11. SPECIAL VALIDATIONS OR VERIFICATIONS**

**12. MANAGEMENT SYSTEM**

A.12.1. The management system should be sufficiently documented to ensure the consistent application of these standards and relevant operational requirement.

**Annex A - Competence criteria related to validation and verification of projects or organizations – (Mandatory Annex)**

**Generic Criteria for competence**

This is based on ISO 14065 Clause 6 - Column 1 refers to relevant ISO 14065 requirements and column 2, 3 and 4 sets out the generic competence criteria related to:

- Project validation
- Project verification
- Organisation verification

*Note 1 - the text has been adapted from the current ISO 14066 (WD2) version.*

*Note 2 - when ISO 14066 has been finalised this Annex will be superseded by ISO 14066.*

ISO 14065 Clause heading related to competence	Criteria of competence		
	Project validation	Project verification	Organisation verification
<p><b>Related to Clause 6.3.2 Validation or verification team knowledge – GHG programme knowledge and skills</b></p>	<p><b>Knowledge</b> A validator shall have applicable GHG programme knowledge, including knowledge of:</p> <ul style="list-style-type: none"> <li>a) eligibility requirements (Note : eligibility requirements includes legal requirements);</li> <li>b) implementation in different jurisdictions as applicable;</li> <li>c) allowable project boundaries and projects including industry sectors and technology areas;</li> <li>d) restriction associated with geographic locations;</li> </ul>	<p><b>Knowledge</b> A verifier shall have applicable GHG programme knowledge, including knowledge of:</p> <ul style="list-style-type: none"> <li>a) eligibility requirements (Note : eligibility requirements includes legal requirements);</li> <li>b) allowable processes, industry sectors and technology areas;</li> <li>c) allowable GHG sources, sinks and reductions;</li> <li>d) geographic boundaries;</li> <li>e) consequences of changes to the GHG programme requirements when being</li> </ul>	<p><b>Knowledge</b> A verifier shall have applicable GHG programme knowledge, including knowledge of:</p> <ul style="list-style-type: none"> <li>a) eligibility requirements (Note : eligibility requirements includes legal requirements);</li> <li>b) allowable processes, industry sectors and technology areas;</li> <li>c) allowable GHG sources, sinks and reductions;</li> <li>d) geographic boundaries, scope of the GHG emissions subject to reporting;</li> <li>e) consequences of changes to the GHG</li> </ul>

	and their impact on the assignment of team members and rigour needed for the assurance; g) challenge findings from team members; and h) manage the development of the statement.	assessment; f) understand the assurance objectives and their impact on the assignment of team members and rigour needed for the assurance; g) challenge findings from team members; and h) manage the development of the statement.	and their impact on the assignment of team members and rigour needed for the assurance; g) challenge findings from team members; and h) manage the development of the statement.

**Annex B - Concept of planning in cases where a GHG assertion related to a grouped project or a GHG assertion relate to several facilities in an organization's GHG inventory (Informative Annex)**

*Note 1 – Sampling related to grouped projects or organisation GHG inventories is not the same as multi site sampling in managements system and hence sampling is not determined by the “square root” approach.*

*Note 2 - This is a critical part in validation or verification planning and as experience is gained additional mandatory document(s) or guidance(s) may be written.*

*Note 3 – The sampling between a number of GHG project plans or GHG assertions, or a mix thereof, is not allowable as that is not defined as a grouped project or a single GHG assertion.*

*Note 4 - The decision on how many projects to sample as part of a GHG assertion related to a grouped project or how many facilities to visit as part of a organisation GHG assertion is determined at the validation and verification planning stage (refer to ISO 14065 Clause 8.3.3) after completion of the strategic analysis and assessment of risks and agreement of scope, criteria, objective, level of assurance and materiality.*

**Validation or verification of a GHG assertion that covers a grouped project**

In determining which projects to sample (in the case above) consideration is given to:

- Agreed level of assurance, materiality, criteria, objectives and scope;
- Complexity of the GHG assertion and GHG project plan;
- Complexity of the projects within the group and their variations and their measurement/monitoring processes;
- Output from the initial evaluation of the GHG information system and controls;
- Organisational environment including the structure of the organisation that develops and manages the GHG assertion;
- Baseline scenario for project validation and verification, including selection and quantification of GHG sources, sinks and reservoirs applicable to the baseline scenario (this incorporates the concept of methodology);
- Variation in baseline scenario between projects in the bundle;
- Identified GHG sources, sinks and reservoirs, and their monitoring;
- Organisational links and interactions between stakeholders, responsible parties, client, and intended users; (for definition refer to ISO 14064-3); and
- GHG programme requirement.

For project verification in addition to the above consideration; the variations in the grouped project's GHG information system and control at the individual project level is considered when determining which projects to sample.

**Verification of a GHG assertion that covers several facilities in a organisation GHG inventory**

In determining which facilities to sample (in the above case) consideration is given to:

- Agreed level of assurance, materiality, criteria, objectives and scope;
- Complexity of the GHG assertion and GHG inventory;
- Complexity of the facilities within the GHG inventory and the variations in the facilities GHG information system and control at facility level and its associated measurement/monitoring processes;
- Output from the initial evaluation of the overall GHG inventory GHG information system and controls and its link and overview of the facility level GHG information system and controls;
- Organisational environment including the structure of the organisation that develops and manages the GHG assertion;
- Process that selects and quantifies the GHG sources, sinks and reservoirs applicable to the GHG inventory;
- Variation in the process that selects and quantifies the GHG sources, sinks and reservoirs applicable to various facilities within the GHG inventory;
- Actual identified GHG sources, sinks and reservoirs, and their monitoring;
- Organisational links and interactions between stakeholders, responsible parties, client, and intended users; (for definition refer to ISO 14064-3); and
- GHG programme requirement.

**Annex C - Help related to validation or verification of a GHG assertion with reference to ISO 14064-3 (Informative Annex)**

*Note 1 - This Annex is informative and does not contain “shall requirements”. The informative text in this Annex is not a “shall requirement”. However the text in many places is associated with requirements laid down in ISO 14064-3. ISO 14064-3 is a normative reference to this IAF Mandatory Document. Explanatory text in this Annex is not to be used to raise non conformity. If a non conformity is identified it should refer to a requirement in ISO 14064-3.*

*Note 2 - Taken from Introduction 0.2 To help understanding and facilitate reading across from the two normative standards, Clause 8 as well as Annex C of this Mandatory Document link the relevant clause titles from ISO 14065 with relevant clause titles from ISO 14064-3. The clause titles from ISO 14064-3 are in blue text and preceded by the reference ISO 14064-3. The process for validation and verification is different from management systems auditing as well as there being a different focus between validation and verification. Annex C has therefore been developed to provide informative guidance related to this process. In Annex C clause headings from ISO 14064-3 have been used to allow understanding of how the application guidance interacts with the normative references. Again the title headings are included but with no application guidance where none was deemed necessary.*

*Note 3 - The text in this document should not be taken as an interpretation of either ISO 14065 or ISO 14064-3.*

**Section 1 – Help related to validation of a GHG assertion with a GHG project plan****ISO 14064-3, Clause 4.4.1, General**

The strategic analysis of a project includes as inputs:

- Agreed level of assurance, materiality, criteria, objectives and scope;
- GHG assertion with the GHG project plan;
- Complexity of project and its measurement/monitoring processes, including whether it is a grouped project;
- Identified GHG sources, sinks and reservoirs, baseline scenario, selection and quantification of GHG sources, sinks and reservoirs applicable to the baseline scenario, monitoring of the GHG project;
- Process/system that delivers the information and data in the GHG project plan and GHG assertion;
- Organisational links and interactions between stakeholders, responsible parties (project proponent in some GHG programmes), client, and intended users; (for definitions refer to ISO 14064-3);
- Organisational environment including the structure of the organisation that develops and manages the GHG project;
- Client justification for the “selection or establishment of the criteria and procedures” reference A.8.3.3.7 and A.8.3.3.8.

*Note - Further guidance is provided in ISO 14064-3 Annex A sections A.2.4.2 – A.2.4.4.*

The inputs to the assessment of risks include:

- Output from the strategic analysis.
- Understanding of how to validate the issues associated with the “selection or establishment of the criteria and procedures” reference A.8.3.3.7 and A.8.3.3.8;
- Output from the evaluation of the project GHG information system and controls;
- Reliability of the external information and data used to justify the identified GHG sources, sinks and reservoirs, baseline scenario, selection and quantification of GHG sources, sinks and reservoirs applicable to the baseline scenario, monitoring of the GHG project.

*Note - Examples of risks in validation include, but are not limited to:*

- *Inherent risks arising from:*
  - *Assigned process for selection or establishment of the criteria and procedures relate to Clauses 5.3, 5.4, 5.5, 5.6, 5.7, 5.8 and 5.10 of ISO 14064-2 is flawed;*
  - *GHG sources, sinks and reservoirs have not be completely identified; and/or*
  - *Information or data in the GHG assertion and GHG project plan contains material discrepancies.*
- *Control risks arising from:*
  - *Project’s process for the selection or establishment of the criteria and procedures has not been correctly implemented;*
  - *Project’s process for the identification of GHG sources, sinks and reservoirs has not been correctly implemented; and/or*
  - *Project’s process for developing the GHG project plan and GHG assertion does not control the risk appropriately.*
- *Detection risks arising from:*
  - *Validators failure to identify that the project’s justification for the selection or establishment of the criteria and procedures is not complete, and does not meet the applicable validation criteria (refer A.1.1) principles; and/or*
  - *Validation team’s failure to identify errors, omissions, misstatements in the GHG assertion and GHG project plan.*

#### **ISO 14064-3, Clause 4.4.2, Validation plan**

In addition to the requirements in ISO 14064-3, Clause 4.4.2, input to the validation plan includes the output from the strategic analysis, assessment of risks and the sampling plan. This includes sampling of information or data to be used to validate the GHG assertion and GHG project plan.

In determining the validation plan, the interdependence and consequences of the following are taken into account:

IAF Mandatory Document for the Application of  
ISO 14065:2007

- Level of assurance - *reasonable assurance* will require a more in depth validation including collection of evidence and supporting information at a detailed level to support the conclusion. *Limited assurance* can be more of an overview process and does not require the detail and depth of validation processes as compared to reasonable assurance.

*Note - ISO 14064-3 Annex A.2.3.2 provides further explanation of level of assurance and its consequences for the validation.*

- Validation objective – this includes as a minimum the validation of the probability that the implementation of the planned GHG project will result in the GHG emission reductions or removal enhancements as stated or claimed by the responsible party.

*Note - ISO 14064-3 Annex A.2.3.3 provides further explanation of validation objectives.*

- Validation criteria – this affect the validation planning in terms of what to look at as well as the detail and depth of the validation activities. Validation criteria are linked to future predictions of GHG emissions and project implementation.

*Note – ISO 14064-3 Annex A.2.3.6 provides further explanation of validation criteria.*

- Validation scope – this includes as a minimum the applicable GHG project including the appropriateness of its boundaries. The complexity of the project including whether it is a grouped project, its location, boundaries etc.

*Note - ISO 14064-3, Annex A.2.3.7, provides further explanation of validation scope.*

- Materiality – The expectation of the intended users or the validation criteria requirements affect materiality. The higher the expectation or requirements that a GHG assertion is free from material errors, omissions or misstatements the more detailed and in depth validation sampling is required (both of information and data).

*Note 1 – the level of assurance generally dictates the depth of sample/testing and materiality the size / detail of sampling (of data and information.)*

*Note 2 - ISO 14064-3, Annex A.2.3.8, provides further explanation of materiality. Specifically - The objective of any validation of a GHG Assertion is to enable the validation body to express an opinion as to whether the GHG assertion is, in all material respects, fairly stated in accordance with the intent of the agreed validation criteria, reference A.1.1. The assessment of materiality is a matter of professional judgement. The concept of materiality recognizes that some matters, either individually or in the aggregate form, are important if the responsible party's GHG assertion is to be presented fairly in accordance with agreed validation criteria. The determination of materiality involves qualitative as well*

*as quantitative considerations. As a result of the interaction of these considerations, discrepancies of relatively small amounts can have a material effect on the GHG assertion.*

- Validation activities and schedules – available client resources, logistics and sufficient time for effective team communication, including handing over of validation trail information/evidence to allow another team member to follow up issues all affect the validation plan.

**ISO 14064-3, Clause 4.4.3, Sampling plan**

**ISO 14064-3, Clause 4.5, Assessment of GHG information system and its controls**

The initial review of the GHG information systems and controls provides an input to the assessment of risks and hence the validation plan and sampling plan.

*Note - ISO 14064-3 Annex A, A.2.5.1.1, A.2.5.1.2, A.2.5.1.3 and A.2.5.2 provides examples of GHG information system and controls.*

The detailed assessment of the GHG information system and controls confirms or rejects the initial review of the GHG information system and controls, by confirming that the system and controls are in place, and that the risks are appropriately managed. In cases where the initial review of the GHG information system and controls are not substantiated by the detailed assessment, the assessment of risks is reviewed and amended as necessary. This includes review and amendment of the validation plan and sampling plan as appropriate.

If the validation criteria imposes requirements on the GHG project related to GHG information system and controls, and these are part of (an) existing accredited management system(s) certification, the validation and body ensures these meet the requirements related to the GHG information system and its controls.

**ISO 14064-3, Clause 4.6, Assessment of GHG data and information**

The validation of GHG data and information is carried out in accordance with the validation plan and the sampling plan

*Note - ISO 14064-3, Annex A.2.6, provides examples of how to carry out this assessment.*

The output from this assessment provides:

- Evidence and findings that act as input to ISO 14064-3 Clause 4.7 and 4.8;
- Rational for amendments to sampling plan and validation plan based on findings and evidence;
- Input to the potential conclusions in the validation statement.

**ISO 14064-3, Clause 4.7, Assessment against validation criteria**

*Note –ISO 14064-3, Annex A.2.7, provide the framework for this assessment*

The output from this assessment provides:

- Evidence and decision on conformance with validation criteria (refer A.1.1.);
- Evidence and findings that act as input to ISO 14064-3 Clause 4.8;
- Rational for amendments to sampling plan and validation plan based findings and evidence;
- Input to the potential conclusions and opinions in the validation statement;
- Evidence and decision on adherence to principles as specified in the validation criteria reference A.1.1; and
- Evidence and decision of the eligibility of the project or organisation GHG assertion to participate in a specific GHG programme if this GHG programme is part of the validation criteria.

**ISO 14064-3, Clause 4.8, Evaluation of the GHG assertion**

*Note - ISO 14064-3, Annex A2.8, provides the framework for this assessment.*

The validation team ensure that all outstanding issues are resolved prior to reaching conclusions and forming opinions.

The validation team input to the validation body independent review process includes a recommendation to the validation body related to the GHG assertion.

**ISO 14064-3, Clause 4.9, Validation statement**

In case where the validation body uses a management letter to communicate non critical issues to client, the validation body ensure that:

- Communicated issues are consistent with the definition of non critical issues;
- Communicated issues are consistent with the findings; and
- Non critical issues would not affect the conclusion and opinion in the validation statement and hence the intended user.

**Section 2 - Help related to verification of either a GHG project or organisation  
GHG assertion****ISO 14064-3, Clause 4.4.1, General**

Verification of a GHG assertion can be for either a project GHG assertion, or an organisational GHG assertion. The verification processes are the same, but the detail and focus changes depending on the scope, criteria, objectives, level of assurance and materiality.

The strategic analysis of a GHG assertion includes as inputs:

- Agreed level of assurance, materiality, criteria, objectives and scope;
- GHG assertion;
- Complexity of project/organisation and its measurement /monitoring processes;
- Identified GHG sources, sinks and reservoirs and its monitoring;
- Process that delivers the information and data in the GHG assertion;
- Organisational links and interactions between stakeholders, responsible party, client, and intended users; (definitions refer to ISO 14064-3); and
- Organisational environment including the structure of the organisation that develops and manages the project's or organisation's GHG assertion.

*Note - Annex A to ISO 14064-3, Clause A.2.4.2 – 4, provides further guidance.*

The inputs to the assessment of risks include:

- Output from the strategic analysis; and
- Output from the evaluation of the project or organisation GHG information system and controls

*Note - Examples of risks in verification include, but is not limited to:*

- *Inherent risk arising from:*
  - *Implementation of assigned process for selection or establishment of the criteria and procedures refer to in A.8.3.3.6 and A.8.3.3.7 is flawed;*
  - *GHG sources, sinks and reservoirs have not been completely identified;*
  - *Information or data in the GHG assertion contains material discrepancies.*
- *Control risk arising from:*
  - *Relevant processes as required in the verification criteria refer to A.1.1. have not be correctly implemented;*
  - *GHG information systems and controls that do not manage the data and information in a manner to reduce the risk of material discrepancies.*
- *Detection risk arising from:*
  - *Verification team failing to identify errors, omissions and misstatements in the GHG assertion.*

The result from the strategic analysis and the assessment of risks are inputs to the verification plan.

**ISO 14064-3, Clause 4.4.2, Verification plan**

Input to the verification plan include the requirements in ISO 14064-3, Clause 4.4.2, and the output from the strategic analysis and assessment of risks and the developed sampling plan (this includes sampling of evidence be that of information or data to verify the GHG assertion).

In determining the verification plan the interdependence and consequences of the following are taken into account:

- Level of assurance - *reasonable assurance* will require a more in depth verification including collection of evidence and supporting information at a detailed level to support the conclusion. *Limited assurance* can be more of an overview process and does not require the detail and depth of verification processes as do reasonable assurance.

*Note - ISO 14064-3 Annex A.2.3.2 provides further explanation of level of assurance and its consequences for the assessment.*

- Verification objective –

*Note ISO 14064-3 Annex A.2.3.4 for projects and A.2.3.5 for organisation provides further explanation of verification objectives.*

- Verification criteria – This affect the verification planning in terms of what to look at as well as the detail of the verification activities.

*Note - ISO 14064-3 Annex A.2.3.6 provides further explanation of verification criteria.*

- Verification scope – relate to the applicable project or organisational GHG assertion. For projects, the complexity of the project as well as whether it is a grouped project, its location, boundaries, monitoring process and report etc. affect the detail and time need for the verification. For organisations, the complexity of the GHG inventory, the number of facilities, boundaries issues etc. affect the detail and time needed for the verification.

*Note - ISO 14064-3, Annex A.2.3.7, provides further explanation of verification scope.*

- Materiality – The expectation of the indented users or verification criteria (refer A.1.1.) requirements affect this. The higher the expectation or requirements that

IAF Mandatory Document for the Application of  
ISO 14065:2007

a GHG assertion is free from material errors, omissions or misstatements, the more detailed the verification sampling (both of information and data).

*Note 1 – Conventionally the level of assurance dictates the depth of sample/testing and materiality the size / detail of sampling (of data and information).*

*Note 2 - ISO 14064-3 Annex A.2.3.8 provides further explanation of materiality. Specifically - The objective of any verification of a GHG Assertion is to enable the verification body to express an opinion as to whether the GHG assertion is, in all material respects, fairly stated in accordance with the intent of the applicable verification criteria (refer A.1.1). The assessment of materiality is a matter of professional judgement. The concept of materiality recognizes that some matters, either individually or in the aggregate form, are important if the responsible party's GHG assertion is to be presented fairly in accordance with verification criteria (refer A.1.1).. The determination of materiality involves qualitative as well as quantitative considerations. As a result of the interaction of these considerations, discrepancies of relatively small amounts can have a material effect on the GHG assertion.*

- Verification activities and schedules –available client resources, logistics and sufficient time for effective team communication, including handing over of verification trail information/evidence to allow another team member to follow up issues all affect the verification plan.

**ISO 14064-3, Clause 4.4.3, Sampling plan**

**ISO 14064-3, Clause 4.5, Assessment of GHG information system and its controls**

The initial review of the GHG information systems and controls provides an input to the assessment of risks and hence the verification plan and sampling plan.

*Note - ISO 14064-3 Annex A 2.5.1.1, A.2.5.1.2, A.2.5.1.3 and A.2.5.2 provides examples of GHG information system and controls*

The detailed assessment of the GHG information system and controls confirms or rejects the initial review of the GHG information system and controls, by confirming or otherwise that the GHG information system and controls are in place, and that the risks are appropriately managed. In cases where the initial review of the GHG information system and controls is not substantiated by the detailed assessment, the assessment of risks should be reviewed and amended as necessary. This includes review and amendment of the verification plan and sampling plan as appropriate.

If the verification criteria imposes requirements on the GHG project or organisation related to GHG information system and controls, and these are part of (an) existing accredited management system(s) certification, the verification body ensures these meet the

requirements related to the GHG information system and its controls.

**ISO 14064-3, Clause 4.6, Assessment of GHG data and information**

The verification of GHG data and information is carried out in accordance with the verification plan and the sampling plan.

The output from this assessment provides:

- Evidence and findings that act as input to ISO 14064-3 Clause 4.7 and 4.8;
- Rational for amendments to sampling plan and verification plan based on findings and evidence;
- Input to the potential conclusions and opinions in the verification statement.

*Note - ISO 14064-3, Annex A.2.6, provides examples on how to carry out this assessment.*

**ISO 14064-3, Clause 4.7, Assessment against verification criteria**

*Note - ISO 14064-3, Annex A.2.7, provide the framework for this assessment*

The output from this assessment provides:

- Evidence and decision on conformance with verification criteria, reference A.1.1;
- Evidence and findings that act as input to ISO 14064-3 Clause 4.8;
- Rational for amendments to sampling plan and verification plan based findings and evidence;
- Input to the potential conclusions and opinions in the verification statement;
- Evidence and decision on adherence to principles as specified in the verification criteria (refer A.1.1); and
- Evidence and decision of the eligibility of the project or organisation GHG assertion to participate in the GHG programme if this is part of the verification criteria.

**ISO 14064-3, Clause 4.8, Evaluation of the GHG assertion**

*Note - ISO 14064-3, Annex A.2.8, provides the framework for this assessment.*

The verification team ensures that outstanding issues are resolved prior to reaching conclusions and forming opinion.

The verification team input to the verification body independent review process includes a recommendation to the verification body related to the GHG assertion.

**ISO 14064-3, Clause 4.9, and verification statement**

In case where the verification body uses a management letter to communicate non critical issues to the client, the verification body ensures that:

Issue 1

IAF Mandatory Document for the Application of  
ISO 14065:2007

- Communicated issues are consistent with the definition of non critical issues;
- Communicated issues are consistent with the findings; and
- Non critical issues would not affect the conclusion or opinion in the verification statement and hence the intended user.
